

English Version :

My name is Mihaly Dobroka. Recently I am a second year student of the Hirosaki University Master Course. I continued my BSc studies in the University of Debrecen, Hungary where besides of my physics studies I had the opportunity to learn Japanese language too. There is a living cooperation between of Universities of Debrecen and Hirosaki. In the frame work of this cooperation I received the possibility to take part in a one year study at the Hirosaki University as an exchange student. During this period I got acquainted with the high level research work of Watanabe Laboratory continued in the field of superconductivity. After my experiences I decided to continue my Physics MSc studies in Hirosaki. The year study period was hard, but interesting. Recently I completed my MSc Thesis in Physics, my subject is „Transport properties of Fe substituted Bi-2212 single crystal”.

I love the Japanese culture and my hobby is Aikido which I practice more than 12 years. The three year in Hirosaki resulted in excellent experiences for me in both personal and professional aspects of view. I feel myself lucky being involved in Japanese way of life.
